Project Initialization and Planning Phase

Date	01 October 2026
Team ID	SWTID-2026-2949
Project Title	Auto Ticket Classification using Flow Designer
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

The proposal report aims to transform ticket handling using Flow Designer automation, boosting efficiency and accuracy. It tackles manual triage inefficiencies, promising faster assignment, fewer misrouted tickets, and happier users. Key features include rule-based auto classification and automatic routing.

Project Overview	
Objective	The primary objective is to automate the classification and routing of incoming IT tickets using ServiceNow Flow Designer, so that every ticket gets the right category, priority and assignment group the moment it is created.
Scope	The project covers rule-based classification of incidents, automatic assignment to support groups, a default queue for unmatched tickets, notifications, and basic reporting. Machine-learning models and integrations outside ServiceNow are outside the current scope.
Problem Statement	
Description	Tickets are triaged manually, so categories and assignment groups depend on individual judgement. This causes misrouted tickets, delayed first response and inconsistent data, which affects SLA compliance and user satisfaction.
Impact	Solving this will cut triage time and reassignments, improve SLA performance and reporting accuracy, free agents for real troubleshooting, and give end users faster, more reliable support.
Proposed Solution	
Approach	Build a Flow Designer flow that triggers when an incident is created or updated, reads keywords from the short description and description, and uses a decision table to set the category, subcategory, priority and assignment group. Tickets with no matching rule go to a default triage queue.
Key Features	- Keyword-based automatic classification of incidents using Flow Designer. - Automatic assignment to the correct support group with priority rules. - Editable decision table so admins can update rules without

	changing the flow. - Default triage queue and notifications to the assignee and caller. - Reports and dashboards to track auto-classification and misroute rates.

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	CPU/GPU specifications, number of cores	ServiceNow cloud instance (no GPU needed); developer laptop with 4 CPU cores
Memory	RAM specifications	8 GB RAM on the developer machine
Storage	Disk space for data, models, and logs	Instance storage managed by ServiceNow; 256 GB SSD on the developer machine
Software		
Frameworks	Platform and low-code framework	ServiceNow Flow Designer
Libraries	Additional libraries / features	Decision Tables, Email Notifications, Reports and Dashboards (optional IntegrationHub)
Development Environment	IDE	ServiceNow Personal Developer Instance (browser-based Flow Designer and Studio)
Data		
Data	Source, size, format	Sample incident tickets created in the instance, about 100, table records / CSV Keyword rule list, about 30 rules, decision table
