Solution Architecture

Date	01 October 2026
Team ID	SWTID-2026-2949
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	5 Marks

Ore 10Solution Architecture Diagram:

Provide a high-level visual representation of your solution's architecture. Use the structural layout below as a template to map out your Presentation Layer, Application Layer, and Data Layer. Fill in the specific technologies and components for your project directly into the boxes to create your architectural diagram.

Component Description Table

Component Name	Description / Role in Architecture	Technologies Used
Presentation Layer	Where users raise and track tickets. Users enter a short description and details, and see the category and assignment once classified.	Service Portal, Next Experience, Virtual Agent, Email
API Gateway / Intake	Receives new tickets from the portal, email or REST calls and creates incident records. ServiceNow's cloud handles load balancing.	REST Table API, Inbound Email Actions
Auth Service	Controls who can log in and what they can see or change, using roles and ACLs. The flow runs under a system user.	SSO, roles, ACLs
Core Logic Service (Flow)	Triggered when an incident is created or updated. Reads keywords, looks up the decision table, then sets category, subcategory, priority and assignment group. Unmatched tickets go to a default queue.	Flow Designer, Decision Table, Update Record action
External API Integrations	Sends notifications to the assignee and caller after classification. Can later connect chat tools.	Email Notifications, IntegrationHub (optional)
Database	Stores incident records, classification rules, assignment groups and flow execution history. Feeds reports and dashboards.	ServiceNow platform database (Incident, Decision Table, sys_user_group)
